This listing of claims replaces all prior versions and prior listings of claims in the application.

1-20. (Canceled)

21. (Currently Amended) A method for communication between ~~at least one~~ a central station and at least one remote mobile or stationary object in a system wherein the at least one object has implemented a sleep mode (S), a standby mode (W) and a first service execution mode (TI), wherein the sleep mode is terminated when a wake up timer elapsed and the standby mode is activated in which the object waits for an incoming message from the central station ~~service center~~ via a cellular and/or a satellite communication for a predetermined period of time, after which the sleep mode is again activated if no message has been received or a requested service is activated if a related message has been received and decoded, and wherein emergency assistance service preempts ongoing phone calls such that ongoing phone calls are interrupted in deference thereto and wherein a conflict concerning simultaneous execution of several services during service subscription is handled automatically by assigning and affecting a priority to each service and deactivating any services with a minor priority than the service with a first priority.

22. (Previously Presented) The method according to claim 21, wherein the at least one object has a phone mode (P) and a second execution mode (T2), wherein the phone mode is interrupted when a service is requested, and the second execution mode (T2) is activated, until a cellular and/or a satellite communication between the object and the central station has been established and the service has been executed.

23-25. (Canceled)

26. (Currently Amended) The method ~~system~~ of claim [[23]] 21, wherein said ~~services~~ service further ~~include~~ includes remote status information, malfunction ~~information,~~ diagnostics and maintenance information, or technical information.

27. (Canceled)

28. (Currently Amended) Method for communication between at least one central station and at least one remote mobile or stationary object by means of transmitting and receiving means wherein said at least one object comprises a cellular phone module, which provides a private subscription for private usage by a driver or operator of the object and a selectable service subscription for transmitting and managing [[of]] at least one service like remote status information, malfunction diagnostics and maintenance as well as technical and emergency assistance, by means of the at least one central station, and wherein the at least one object has implemented a sleep mode in which the power consumption is minimal, a standby mode in which the at least one object is powered up and waits for an incoming message comprising a service identifier from at least one central station via a cellular and/or satellite communication, and a first service execution mode for activating the identified service and wherein a conflict concerning simultaneous execution of several services during said selectable service subscription is handled automatically by assigning and affecting a priority to each service and deactivating any services with a minor priority than the service with a first priority.

29. (Previously Presented) The method according to claim 28, wherein the sleep mode is terminated and the standby mode is activated when a wake up timer elapsed.

30. (Previously Presented) The method according to claim 28, wherein the standby mode is activated for a predetermined period of time, after which the sleep mode is again activated if no message has been received, or the first service execution mode and a requested service is activated if a related message has been received and decoded.

31. (Previously Presented) The method according to claim 28, wherein at least one object has implemented a phone mode and a second execution mode, wherein the phone mode is interrupted when a service is requested, and the second execution mode is activated, until a

cellular and/or a satellite communication between at least one object and at least one central station has been established and the requested service has been executed.

32. (Canceled)

33. (Previously Presented) The method according to claim 28, wherein the service subscription or a transition from private subscription to service subscription is initiated periodically and/or upon request of at least one central station or of at least one object, and/or by a key press of the operator and/or automatically by means of at least one sensor for detecting accidents, emergency or malfunctions of at least one object or by means of a further sensor for detecting an air-bag deployment or by an alarm in case of a theft.

34. (Currently Amended) A central station comprising a means for wirelessly transmitting data to a remote ~~communicating~~ communication object and managing at least one service ~~system~~ of said remote ~~communicating~~ communication object chosen from the following group including (1) a remote status information ~~system~~, (2) a malfunction diagnostics ~~system~~, (3) ~~a maintenances system~~ maintenance, (4) [[a]] technical assistance, ~~system~~ and (5) [[an]] emergency assistance ~~system~~, and wherein the data wirelessly transmitted to the remote ~~communicating~~ communication object comprises a message including a selected service identifier sent by one of cellular and satellite transmission; wherein said remote ~~communicating~~ communication object comprises a cellular phone module that provides ~~one of~~ a private subscription for private usage by an operator of the object and a selectable service subscription for transmitting data of the at least one service system; and wherein the remote communication object has ~~a periodically~~ an implementable sleep mode in which minimal power is consumed, ~~a periodically~~ an implementable standby mode in which the remote communication object is powered up and waits for the incoming message including the service identifier and an implementable first service execution mode that activates the identified service system, and further comprising means for automatically resolving conflict associated with simultaneous execution of several services during said selectable service subscription by assigning and affecting a priority to each service and deactivating any services with a minor priority than the service with a first priority.

35. (Previously Presented) The central station according to claim 34, wherein the central station (10) is a customer service center.

36. (Previously Presented) The central station according to claim 34, wherein said central station is configured to activate the service subscription.

37. (Currently Amended) A ~~communicating~~ communication object comprising a cellular phone module for providing a private subscription for private usage by a driver or operator of the object and a selectable service subscription for transmitting and managing [[of]] at least one service like remote status information, malfunction[[,]] diagnostics and maintenance as well as technical and emergency assistance, wherein the object has implemented a sleep mode in which the power consumption is minimal, a standby mode in which the object is powered up and waits for an incoming message comprising a service identifier via a cellular and/or satellite communication, and a first service execution mode for activating the identified service, and further comprising means for automatically resolving conflict associated with simultaneous execution of several services during said selectable service subscription by assigning and affecting a priority to each service and deactivating any services with a minor priority than the service with a first priority.

38. (Currently amended) A ~~communicating~~ communication object according to claim 37, wherein in the standby mode, the cellular phone module, in the standby mode, is activated and the service subscription is selected.

39. (Currently amended) A communicating object according to claim 37, wherein the sleep mode is terminated ~~the cellular phone module, in the sleep mode, terminates~~ and the standby mode is activated when a wake up timer elapses.

40. (Currently amended) A ~~communicating~~ communication object according to claim 37, wherein the standby mode is activated for a predetermined period of time, after which the sleep mode is again activated if no message has been received or the first service execution mode and a requested service is activated if a related message has been received and decoded.

41. (Currently amended) A ~~communicating~~ communication object according to claim 37, which has implemented a phone mode and a second execution mode, wherein the phone mode is interrupted when a service is requested, and the second execution mode is activated, until a cellular and/or a satellite communication between the object and at least one central station has been established and the requested service has been executed.

42. (Currently amended) A ~~communicating~~ communication object according to claim 37, wherein the service subscription or a transition from private subscription to service subscription is initiated periodically and/or upon request of at least one central station or of at least one object, and/or by a key press of the operator and/or automatically by means of at least one sensor for detecting accidents, emergency or malfunctions of at least one object or by means of a further sensor for detecting an air-bag deployment or by an alarm in case of a theft.

43. (Previously Presented) A communication object according to claim 37, further comprising at least one of a user interface manager, a satellite communication module, a GPS controller and at least one emergency sensor for automatically detecting accidents, emergency or malfunctions of the object.

44. (Currently amended) A ~~communicating~~ communication object according to claim 37, further comprising a controller module for performing priority management between different services.

45. (Currently amended) A ~~communicating~~ communication object according to claim 37, wherein the object is a vehicle, a boat or ship, an airplane or stationary equipment like facility or plant.

46. (Currently amended) A ~~communicating~~ communication object according to claim 37, wherein a satellite communication is provided for activation if the cellular communication is not available.

47. (New) A system comprising at least one central station, at least one remote mobile or stationary object and transmitting and receiving means for communication between the at least one central station and the at least one remote mobile or stationary object, wherein the at least one remote mobile or stationary object comprises a cellular phone module, which provides a private subscription for private usage by a driver or operator of the object and a selectable service subscription for transmitting and managing at least one service like remote status information, malfunction diagnostics and maintenance as well as technical and emergency assistance, by means of at least one central station, and wherein the at least one remote mobile or stationary object has implemented a sleep mode in which the power consumption is minimal, a standby mode in which the at least one remote mobile or stationary object is powered up and waits for an incoming message comprising a service identifier from at least one central station via a cellular and/or satellite communication, and a first service execution mode for activating the identified service, and further comprising means for automatically resolving conflict associated with simultaneous execution of several services during said selectable service subscription by assigning and affecting a priority to each service and deactivating any services with a minor priority than the service with a first priority.

48. (New) A system according to claim 47, wherein said central station is configured to activate the service subscription.

49. (New). A system according to claim 47, wherein the satellite communication (31) is provided for activation if the cellular communication (30) is not available.

50. (New) A method for communication between a central station and a remote object having a single cellular phone module which provides a private subscription for private usage by an operator of the object and a selectable service subscription for managing execution of a plurality of prioritized non-emergency service requests received at the object and wherein the object implements a sleep mode in which power consumption is minimal, a standby mode in which the object is powered up and waits for incoming messages, each comprising a non-emergency service request identifier, from the central station via the single cellular phone module and a service execution mode that activates a priority non-emergency requested service from the received prioritized non-emergency service requests.

51. (New) The method according to claim 50, wherein the plurality of prioritized non-emergency service requests include at least two of the following: a remote status information request, a malfunction information request, a diagnostics information request, a maintenance information request and a technical information request.

52. (New) The method according to claim 37, wherein the plurality of prioritized non-emergency service requests include at least two of the following: a remote status information request, a malfunction information request, a diagnostics information request, a maintenance information request and a technical information request.
